### **Background**

The Virginia Department of Health (VDH) currently receives data on visits to 78<sup>1</sup> acute care hospital emergency departments (EDs) and 16<sup>1</sup> free-standing EDs in Virginia for purposes of public health surveillance. The purpose of this report is to characterize ED visit trends for unintentional overdose by opioids and heroin among Virginia residents.

Chief complaints and discharge diagnoses of ED visits are analyzed by VDH to identify and monitor issues of public health concern across Virginia. The chief complaint is a free-text field that captures the patient's primary reason for seeking medical care as interpreted by the ED registration staff. The discharge diagnosis is a coded field using standardized values defined by the International Classification of Diseases (ICD) 9<sup>th</sup> and 10<sup>th</sup> Revision or SNOMED Clinical Terms (CT) code sets.

### Methodology

ED visits defined as unintentional overdose by opioid or unspecified substance include those with medical and non-medical use of a prescription opioid or where the substance is not specified, and must meet the following criteria:

- Inclusion criteria for Chief Complaint or Discharge Diagnosis: Terms: overdose, opioid, opiate, opium, morphine, hydrocodone, oxycodone, hydromorphone, oxymorphone, codeine, buprenorphine fentanyl, methadone, naloxone, tramadol, suboxone, or medication and drug brand names (Dilaudid, Narcan, OxyContin, Percocet, Vicodin, etc.); ICD-9 codes: 965.00, 965.02, 965.09, E850.1, E850.2; ICD-10 codes: T40.0X1, T40.0X4, T40.2X1, T40.2X4, T40.3X1, T40.3X4, T40.4X1, T40.4X4, T40.601, T40.604, T40.691, T40.694, F11.10, F11.120, F11.121, F11.122, F11.129, F11.20, F11.220, F11.221, F11.222, F11.229, F11.90, F11.920, F11.921, F11.922, F11.929; SNOMED CT codes: 295165009, 242253008, 297199006, 295213004.
- **Exclusion** criteria for Chief Complaint or Discharge Diagnosis: Terms: *withdrawal, detoxification, suicide, intentional, self-harm, or any specified non-opioid medication or drug;* ICD-9 codes: *E95-97, V62.84;* ICD-10 codes: *R45.851;* Term: *heroin;* SNOMED CT code: *295174006.*

ED visits defined as unintentional overdose by heroin must meet the following criteria:

- Inclusion criteria from Chief Complaint or Discharge Diagnosis: Terms: heroin, speedball, dope; ICD-9 codes: 965.01, E850.0; ICD-10 codes: T40.1X1A, T40.1X4A; SNOMED CT codes: 295174006, 295175007, 295176008.
- **Exclusion** criteria from Chief Complaint or Discharge Diagnosis: Terms: withdrawal, detoxification, suicide, intentional, self-harm; ICD-9 codes: E95-97, V62.84; ICD-10 codes: R45.851.

As of June 2018, VDH revised the case definitions above based on guidance from the Centers for Disease Control and Prevention (CDC) as well as findings from a data quality evaluation conducted by VDH. More information on the case definition revisions, including historic definitions, can before found here.

ED visits for unintentional overdose by opioid or unspecified substance and heroin are presented by count or rate per 100,000 population. Rates are calculated using U.S. Census Bureau 2016 population estimates. To protect confidentiality and maintain accurate rate calculations, ED visit counts of 1 to 4 and rates with numerators of 1 to 4 are suppressed in this report. Counts of 0 are included.

The geographic location is assigned based on the patient's residential zip code provided. A single zip code may span multiple city and county localities in Virginia. If a patient resides in such a zip code, the visit is assigned to the locality where the majority of the population resides. Virginia city and county populations combined to calculate a rate per 100,000 population because of zip codes spanning multiple localities can be found in <u>Appendix 1</u>.

### **Highlights for July 2018**

**Note:** Please review the revisions applied to the ED visits case definitions as of June 2018, found <a href="here">here</a>. While the revised case definitions have increased the sensitivity of capturing valid unintentional overdoses among ED visits reported to VDH, the interpretation of the overdose trends and data found in this report are not impacted.

Statewide ED visits for overdose by opioid or unspecified substance among Virginia residents increased by 3% from June 2018 (613 visits) to July 2018 (632 visits) (<u>Figure 1A</u>). The total Year-to-Date (January to July) count of ED visits is 16% lower in 2018 as compared to 2017, and 13% lower as compared to 2016 (<u>Figure 1B</u>).

- Among the five <u>VDH Health Planning Regions</u>, rates of visits for overdose by opioid or unspecified substance were highest in the Southwest (11.6 per 100,000) and Central (10.8 per 100,000) regions. The lowest rate was in the Northern region (5 per 100,000) (Figure 1C). The Year-to-Date 2018 count for all health regions are lower than their 2017 visit count. The Year-to-Date visit counts for Eastern and Northern regions have decreased annually since 2016 (Figure 1D).
- By sex, males contributed a statistically higher proportion of visits for overdose by opioid or
  unspecified substance compared to females. This is a change from the previous 3 months where
  no significant difference between males and females was observed. (Figure 1E).
- By age group, the number of visits for overdose by opioid or unspecified substance among 25-34 year olds decreased by 6% but remained the age group with the highest rate (11.3 per 100,000) in July 2018 (Figure 1F). Four out of the seven age groups experienced an increase or no change in July 2018.

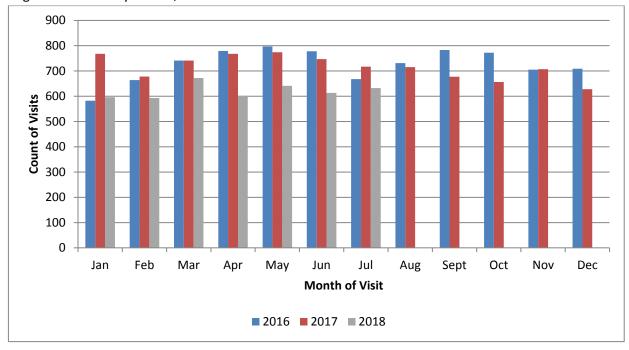

Statewide ED visits for overdose by heroin among Virginia residents decreased by 15% from June 2018 (117 visits) to July 2018 (100 visits) (Figure 2A). The total Year-to-Date (January to July) count of ED visits is 20% lower in 2018 compared to 2017, and 4% lower as compared to 2016 (Figure 2B).

- Among the five <u>VDH Health Planning Regions</u>, rates of visits for overdose by heroin were highest in the Central region (1.8 per 100,000). The visit rate for Eastern region has decreased from May (3.7 per 100,000) to July (1.6 per 100,000). The lowest rate was in the Northern region (0.6 per 100,000) (<u>Figure 2C</u>). The Year-to-Date 2018 visit count for all health regions are lower than their 2017 visit count, except for the Central region (<u>Figure 2D</u>).
- By sex, males contributed a statistically higher proportion of visits for overdose by heroin compared to females in July 2018, and this significant rate difference has been observed since April 2018 (Figure 2E).
- By age group, the rate of visits for overdose by heroin was the highest in the 25-34 year old age group (2.6 per 100,000) in July 2018, and has been higher than any other age groups since January 2015 when reporting by VDH began. However, the number of visits for the 25-34 year old age group has decreased by 50% since May 2018 (Figure 2F).

## **Appendix 1**

#### Virginia Localities Combined for the Purposes of Rate Calculation per 100,000 Population

- Alleghany County and Covington City
- Albemarle County and Charlottesville City
- Augusta County, Staunton City, and Waynesboro City
- Chesterfield County and Colonial Heights City
- Frederick County and Winchester City
- Fairfax County, Fairfax City, and Falls Church City
- Grayson County and Galax City
- Greensville County and Emporia City
- Henry County and Martinsville City
- Montgomery County and Radford City
- Pittsylvania County and Danville City
- Prince George County, Hopewell City, and Petersburg City
- Prince William County, Manassas City, and Manassas Park City
- Roanoke County, Roanoke City, and Salem City
- Rockingham County and Harrisonburg City
- Rockbridge County, Buena Vista City, and Lexington City
- Southampton County and Franklin City
- Washington County and Bristol City
- Wise County and Norton City

## **Appendix 2**

#### Summary of Data Reporting Changes by Emergency Departments in Virginia

The volume and quality of data reported by emergency departments to the Virginia Department of Health for syndromic surveillance affect the volume and quality of data in this report. In general, volume and quality have improved over time as additional EDs report to the Virginia Department of Health. This general increase in data volume should be taken into consideration when interpreting trends in visit counts and rates over time. Occasionally, EDs stop reporting data, which can lead to a decrease in data volume and a lowering of trends. Other factors that can affect the data are changes in the quality reported by EDs, which can improve or reduce the accuracy of the data.

Please consider the following data reporting changes when interpreting the contents of *Emergency Department Visits for Overdose by Opioid, Unspecified Substance and Heroin among Virginia Residents* reports.

Month	<b>Health Region</b>	Description
June 2017	Eastern	A single healthcare system representing five acute care hospital EDs became unable to report data, reducing the quantity and representativeness of the data from this region.
June 2017	Northwest	One acute care hospital ED improved its data quality, supporting more accurate capture of overdose visit data.
February 2018	Central	One additional acute care hospital ED began reporting data to VDH, increasing the quantity and representativeness of data from this region.
March 2018	Central	Four additional free-standing EDs began reporting data to VDH, increasing the quantity and representativeness of data from this region.
April 2018	Southwest	Two additional acute care hospital EDs began reporting data to VDH, increasing the quantity and representativeness of data from this region.
April 2018	Northern	One acute care hospital ED became unable to report data, reducing the quantity and representativeness of the data from this region.  Update: This hospital ED began reporting data again to VDH as of the June 2018 report.
June 2018	Northwest	Two acute care hospital EDs and one free-standing ED became unable to report data, reducing the quantity and representativeness of the data from this region.
